## I INTRODUCTION

#### I.I Scope and definitions

This manual provides installation, operation and maintenance instructions for the Ingersoll Rand Series 2000 and S2H22-53 Blowers, abbreviated to "blowers" in the remainder of this manual. You must use the blower as specified in this manual.

Read this manual before you install the blower. Important safety information is highlighted as WARNING and CAUTION instructions; you must obey these instructions. The use of WARNINGS and CAUTIONS is defined below.

#### WARNING

Warnings are given where failure to observe the instruction could result in injury or death to people.

#### CAUTION

Cautions are given where failure to observe the instruction could result in damage to the equipment, associated equipment and process.

The units used throughout this manual conform to the SI international system of units of measurement. Equivalent values in imperial units are also included.

An identification and rating plate will be fitted to the top of the blower body casing, or to the gear cover. This plate provides specific details about the blower, such as its Item Number and so on.

The following warning and other symbols are on the blower:

Warning – refer to accompanying documentation.

Warning - hot surfaces.

www.fraserwoods.ca

## 1.2 Description

Refer to Figure 2. The Series 2000 and S2H22-53 blowers are positive displacement blowers, cooled by ambient air circulation.

The blowers are supplied in 'bareshaft' form. You must connect your own coupling or belt drive system (see Section 3.7) to the drive shaft in order to operate the blower.

The blowers are available in two different versions:

- 'H' version blowers, which are installed horizontally, and provide for a vertical gas flow through the blower.
- 'V' version blowers, which are installed vertically, and provide for a horizontal gas flow through the blower.

S2H/V blowers have BSP inlet and outlet connections and S2H/VN blowers have NPT inlet and outlet connections (see Section 2.6 and Figure 3).

Refer to Section 2.8 for the Item Numbers of the different blower versions.

## 1.3 Applications

All of the blowers are suitable for pressure or vacuum operation.

The blowers are suitable for pumping/compressing ambient air, and non-flammable gases, gas mixtures and dusts. The blowers are **not** suitable for pumping/compressing flammable or pyrophoric gases, gas mixtures and dusts.

The materials of construction of the blowers are specified in Section 2.7. Before you use the blower, you must ensure that these materials are compatible with the gases and vapours which you will pump/compress or which may exist in the external atmosphere.

You must ensure that your blower is suitable for your application.

If you have any doubts as to the suitability of the blower for your application, contact your supplier or Ingersoll Rand for advice.

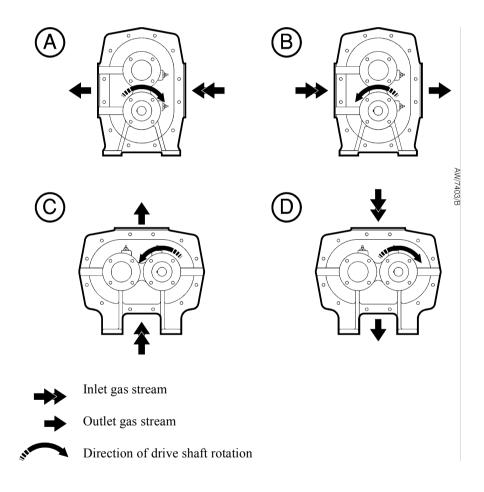

## 1.4 Principle of operation

The Series 2000 and S2H22-53 blowers are positive displacement blowers, which incorporate a pair of two-lobe contra-rotating rotors. One of the rotors is driven by the drive shaft. The other rotor is maintained in the correct phase relation by oil lubricated timing gears in the gear cover.

As the rotors turn, gas which enters the inlet is trapped in the chambers which form between the rotors and the body casing, and is eventually forced out of the blower at the discharge (outlet).

The rotors can operate (rotate) in either direction. The direction of gas flow through the blower is therefore determined by the direction of rotation of the drive shaft, as shown in Figure 1.

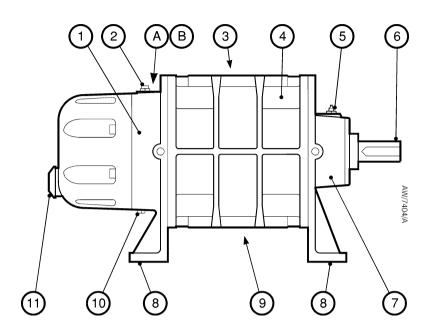

You must ensure that your drive system (connected to the drive shaft) is correctly configured for your system design.

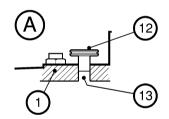

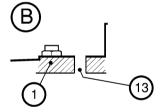

- A Vertical orientation: clockwise rotation
- B Vertical orientation: anticlockwise rotation
- C Horizontal orientation: anticlockwise rotation
- D Horizontal orientation: clockwise rotation

Figure  $\,I\,$  – Orientations and directions of gas flow through the blowers

## 2 TECHNICAL DATA

## 2.1 Operating and storage conditions

Ambient operating temperature range	-20 to 40 °C, -4 to 104 °F
Ambient storage temperature range	-20 to 80 °C, -4 to 176 °F
Maximum ambient operating humidity	90%
Maximum operating altitude *	1000 m, 3280 ft

<sup>\*</sup> The blowers may be suitable for operation at higher operating altitudes, depending on your installation and application: contact your supplier or Ingersoll Rand for advice.

Table 1 – Operating and storage conditions

#### 2.2 Performance

Performance data is shown in Tables 3 to 13 (page 6 to page 16).

Notes: The "given pressures" specified in Tables 3 to 13 are the differential pressures across the blower (that is, the differential pressures between the blower inlet and outlet).

The "r.p.m./r min<sup>-1</sup>" rotation speeds specified in Tables 3 to 13 are provided for information only, to identify blower performance at the specified speed. During operation, the rotation speed of the blowers need not be limited to these specified speeds.

The maximum vacuum values given in Tables 3 to 13 are for a flow through the blower. You must not exceed these values. otherwise the blower may be damaged and/or seize.

## 2.4 Noise and vibration data

Note: The noise and vibration data values given below are maximum values, with pipelines connected to the blower inlet and outlet. The actual values will depend on the installation and the operating conditions.

Noise level: dB(A)	95 dB(A)
Vibration level	18 mm s <sup>-1</sup> , 0.71 inches s <sup>-1</sup>

Table 14 – Noise and vibration data

## 3 INSTALLATION

#### **CAUTION**

Ingersoll Rand will accept no liability or warranty claims if your installation includes any modifications or additions to the blower without the prior written approval of I, or if the blower is incorrectly installed.

#### 3.1 Installation safety

#### WARNING

Obey the safety instructions listed below and take note of appropriate precautions when you install the blower.

- A suitably trained and supervised technician must install the blower.
- Ensure that debris and dust does not get into the blower when you install it.
- Check that all of the required components and tools are available and of the correct type before you start to install the blower.
- Where applicable, use suitable new gaskets/seals to connect the blower into your system. Do not reuse old gaskets/seals.
- If you will fit the blower into an existing system, disconnect the power from the drive system before you start installation, so that the drive system cannot be operated accidentally.

## 3.2 System design

Your system must be suitably designed for correct operation of the blower. Note that:

- You must design suitable pipelines to fit the blower inlet/outlet connections. Refer to Section 2.6
  and to Figures 3 and 4 for the dimensions of the blower inlet and outlet connections.
- Your system design must ensure that, when the blower is in its final operating location, you can see the oil-level sight-glass and can access the oil filler and drain plugs, and the bearing greasing points.
- Your system design must ensure that the blower cannot be operated with the inlet or outlet pipelines obstructed.

We also recommend that your system incorporates an emergency stop facility which, once activated, must be manually reset before the blower can be operated again.

Also note the following when you design your system:

- We recommend that you incorporate a filter in the inlet pipeline to the blower, to prevent the entry of particles or debris into the blower.
- The blower must be level (within 15° in any of the horizontal mounting axes) for correct operation.
- We recommend that you incorporate silencers, to attenuate the pulsations in the inlet/outlet gas streams.
- There must be sufficient free space around the blower, for adequate cooling-air circulation.
- If required, install your own acoustic enclosure around the blower. If you do install such an enclosure, ensure that there is sufficient space for cooling-air flow around the blower: see above.

#### 3.3 Unpack and inspect

#### WARNING

Use suitable lifting equipment to move the blower. If you do not, you can injure yourself or damage the blower. Refer to Section 2.3 for the mass of the blower.

- Use a suitable fork-lift truck or pallet truck to move the blower, on its pallet, close to where you
  will install it:
  - On S2H blowers, attach the lifting equipment to the lifting bolts on the blower. (The number
    of lifting bolts fitted depends on the blower model.)
  - On 2000 series blowers, fit slings under the gear cover and under the bearing cover, then attach the lifting equipment to the slings.
- Remove all packing materials and protective covers and check the blower. If the blower is damaged, notify your supplier and the carrier in writing within three days; state the Item Number of the blower together with your order number and your supplier's invoice number. Retain all packing materials for inspection. Do not use the blower if it is damaged.
- 3. Check that you have received the items listed in Table 20. If any item is missing, notify your supplier in writing within three days
- 4. Look at the blower rating and identification plate and check that the blower is suitable for use in your system. If the blower is not suitable for use in your system, do not continue to install the blower: contact your Supplier or Ingersoll Rand.

If the blower is not to be used immediately, replace the protective covers. Store the blower in suitable conditions, as described in Section 6.1.

Quantity	Description	Check
I	Blower	
*	Gear cover oil	

<sup>\*</sup> If you have ordered oil, you will receive sufficient quantity of the correct oil to fill the blower: see Section 2.5.

Table 20 – Checklist of items

#### 3.4 Locate the blower

## WARNING

Use suitable lifting equipment to move the blower. If you do not, you can injure yourself or damage the blower. Refer to Section 2.3 for the mass of the blower.

Ensure that the operating location is clean and free from debris and oil.

You must ensure that when the blower is in its required operating location, all of the mounting feet are in the same plane, flat on the mounting platform. The platform must be firm and level, with a maximum flatness deviation less than 0.2 mm m<sup>-1</sup>.

Do **not** use shims or spacers under the mounting feet to level the blower.

Use the following procedure to locate the blower:

- 1. Use the lifting equipment to move the blower to its required operating location: use the method given in Step 1 of Section 3.3.
- 2. Disconnect your lifting equipment from the blower.
- 3. Fit suitable bolts through the fixing holes in the mounting feet (Figure 2, items 8), to secure the blower in position.

#### 3.5 Connect the blower

#### 3.5.1 Introduction

Take note of the following when you connect the blower into your system:

- For optimum performance, ensure that the system pipelines connected to the blower are as short as possible.
- Support your system pipelines and other components, to prevent loading of the inlet and outlet ports on the blower.
- Incorporate flexible components in your system, to minimise noise and vibration.
- Where necessary, use gaskets/seals which are compatible with the gases which will be pumped/compressed, and with the operating conditions.
- The leak tightness of your system connections must be in accordance with the requirements of your applications.

## 3.5.2 Connect the blower into your system

Use the following procedure to connect the blower into your system:

- 1. Use a suitable gasket/seal to connect your inlet pipeline to the blower inlet (Figure 2, item 3 or 9).
- 2. Use a suitable gasket/seal to connect your outlet pipeline to the blower outlet (Figure 2, item 3 or item 9).

#### 3.6 Fill the blower with oil

#### **CAUTION**

Ensure that you use the correct grade of oil and that the oil level is correct. If you do not, the blower may be damaged during operation, or its performance may be affected.

Before you commission and operate the blower, you must fill the gear cover (Figure 2, item 1) with oil: refer to Section 5.4.

#### 3.7 Fit the drive/transmission

#### WARNING

Your drive and transmission system design must ensure that the maximum blower rotational speeds specified in Section 2.2 cannot be exceeded.

#### WARNING

You must fit suitable guards to protect people from rotating/moving parts.

You must use a suitable coupling or a belt drive and transmission system to connect your drive to the blower.

Your drive and transmission system design must ensure that the radial and axial loadings on the blower drive shaft are as low as possible. The radial and axial loadings **must** be below the maximum loadings specified in Table 21 (page 29).

Connect the components of the drive and transmission system to the blower drive shaft (Figure 2, item 6) as described in the manufacturer's instructions supplied with the components.

#### 3.8 Check the direction of rotation

#### WARNING

If you remove a guard during the following procedure, ensure that you do not come into contact with the shaft, the coupling/belt or the drive system when you operate the blower. If you do, you may be injured by the rotating components.

## CAUTION

Ensure that the blower rotates in the correct direction. If it does not, your system will not operate correctly.

After you have connected the drive/transmission, check the direction of rotation of the blower as follows:

- 1. If necessary (that is, to make it easier to see the blower drive shaft), temporarily remove any guard over the drive coupling or belt.
- 2. Refer to Figure 2. Watch the blower drive shaft (6) while you start up the blower (refer to Section 4.2), then shut down the blower (refer to Section 4.3) after two seconds or so.
- 3. Check that the blower drive shaft (6) rotated correctly in the expected direction. (This depends on your application and installation configuration: see Section 1.4.)
- 4. If the direction of rotation was incorrect:
  - Check the installation of the drive and transmission system and reconfigure as appropriate.
  - Perform the direction of rotation check from Step 2 again, to ensure that the blower now rotates in the correct direction.
- 5. If you have removed the guard over the drive coupling or belt (as in Step I above), refit the guard.

Blower	Maximum loadings: N *		Maximum loadings: lbf *	
	Radial	Axial	Radial	Axial
S2H22/23H/V	260	28	58.4	6.2
S2H31/32/33H/V	500	55	112.4	12.3
S2H41/42/43H/V822	770	84	173.1	18.8
S2H51/52/53H/V	1490	16	334.9	3.5
2022/2023H/V	260	28	58.4	6.2
2031/2032/2033H/V	500	55	112.4	12.3
2041/2042/2043H/V	770	84	173.1	18.8
2051/2052H/V	1490	16	334.9	3.5

<sup>\*</sup> These are the maximum loadings that can be applied to the **end** of the drive shaft.

Table 21 – Maximum drive shaft loadings

#### 3.9 Commission the blower

#### CAUTION

Commission the blower as described below before you operate the blower as described in Section 4.

After you have installed the blower, use the following procedure to commission it and prepare it for subsequent operation:

- 1. Ensure that any valves in the inlet and outlet pipelines are open.
- 2. Engage your drive and transmission system to start the blower.
- 3. Operate the blower, with no gas load, for at least 15 minutes. During this time:
  - Monitor the external surfaces of the blower and check for 'hot spots' (that is, areas which are unusually hot).
  - If any hot spots persist at the end of the 15 minutes, contact your supplier or Ingersoll Rand for advice.
- 4. Continue to operate the blower with a representative gas load, and check that the pump operates correctly and provides the required performance.
  - If necessary, refer to Section 5.10 if any fault conditions occur.
- 5. Disengage your drive and transmission system to stop the blower.

The blower is now ready for normal operation.

## 4 OPERATION

#### CAUTION

Ingersoll Rand will accept no liability or warranty claims if your blower is used on applications or in a way prohibited in this manual, or not specified in this manual.

## 4. I General operational safety

#### WARNING

Obey the safety instructions and precautions listed below. If you do not, there may be a risk of injury or death to people, or damage to the blower.

- Do not operate the blower when the cooling-air flow around the blower is restricted (see Section 3.2). If you do, the blower may overheat.
- Do not operate the blower with the blower inlet or outlet ports open to the atmosphere. If you do, your fingers or other parts of your body or clothing may get trapped, and you may be injured by the rotating mechanisms in the blower.
- Do not operate the blower with the guards removed from the blower drive shaft, the coupling/belt
  or the drive system. If you do, your fingers or other parts of your body or clothing may get trapped,
  and you may be injured by the rotating components.
- Prevent accidental contact with the hot blower, and do not place flammable materials on the blower. During operation, the temperature of external parts of the blower can exceed 70  $^{\circ}$ C (158  $^{\circ}$ F).
- Never disconnect any of the connecting pipelines (for example, the pipeline connected to the inlet) when the blower is operating.
- Do not expose any part of your body to vacuum. If you do, you may be injured.
- During pressure operation, prevent accidental contact with the discharged (outlet) gas stream. This gas stream may be at high pressure and can be hot and cause burn injury.
- Do not attempt to use the blower to pump/compress liquids. The blowers are not designed for this application.
- Where necessary (for example, if you have not fitted an acoustic enclosure), wear suitable ear defenders. The pump can be noisy during operation (refer to Section 2.4).

# **PERATION**

#### Series 2000 and S2H22-53 Blowers

## 4.2 Start-up

- 1. Check the oil-level in the blower: refer to Section 5.4.
- 2. Ensure that any valves in the inlet and outlet pipelines are open.
- 3. Engage your drive and transmission system to start the blower.

You can now use the blower as required in your application.

#### 4.3 Shut-down

Disengage the drive and transmission system to stop the blower.

## 5 MAINTENANCE

## 5. I Safety information

#### WARNING

Obey the safety instructions given below and take note of appropriate precautions. If you do not, you can cause injury to people and damage to equipment.

- A suitably trained and supervised technician must maintain the blower. Obey your local and national safety requirements.
- Ensure that the maintenance technician is familiar with the safety procedures which relate to the gases pumped/compressed by the system in which the blower is installed.
- Allow the blower to cool to a safe temperature before you start maintenance work.
- Isolate the blower from the drive system so that it cannot be operated accidentally.
- Recheck the blower rotation direction (see Section 3.8) if the drive and transmission system has been disconnected and then reconnected.
- Take care to protect inlet/outlet port sealing faces from damage.
- Do not reuse seals/gaskets if they are damaged.
- Do not touch or inhale the thermal breakdown products of fluorinated materials which may be present if the blower has been heated to 260 °C (500 °F) and above. These breakdown products are very dangerous. Fluorinated materials in the blower include seals. The blower may have overheated if it was misused, if it malfunctioned or if it was in a fire. Ingersoll Rand Material Safety Data Sheets for fluorinated materials used in the blower are available on request: contact your supplier or Ingersoll Rand.
- Check the leak tightness of the system connections after maintenance work is complete if you have connected or disconnected the blower inlet or outlet joints. The leak tightness of the system connections must be in accordance with the requirements of your applications.

## 5.2 Maintenance plan

Note: The maintenance frequencies given in Table 22 are based on a maximum blower usage of 2000 hours per year. If your blower usage exceeds this, you must adjust the maintenance frequencies for your blower accordingly

The plan in Table 22 (page 33) details the maintenance operations required to maintain the blower in normal operation. Instructions for each operation are given in the section shown.

When you maintain the blower, use Ingersoll Rand spares: refer to Section 7.3.

Operation	Frequency	Refer to Section
Inspect the oil-level sight-glass	Weekly	5.3
Check the oil-level	Weekly	5.4
Inspect the system installation	Monthly	5.5
Relubricate the bearings	3 Monthly	5.6
Change the oil	Yearly	5.7
Clean/replace the gear cover vent/filter	When necessary	5.8
Overhaul the blower	5 yearly or when necessary	5.9

Table 22 – Maintenance plan

## 5.3 Inspect the oil-level sight-glass

Refer to Figure 2. Look at the oil-level sight-glass (11) on the gear cover (1):

- If the sight-glass is dirty, use a suitable cloth to wipe it clean.
- If the sight-glass is damaged (that is, scratched, cracked or corroded), or if there are signs of oil leakage from the sight-glass, you must replace it: contact your supplier or Ingersoll Rand.

#### 5.4 Check the oil level

#### **CAUTION**

Ensure that you use the correct grade of oil and that the oil level is correct. If you do not, the blower may be damaged during operation, or its performance may be affected.

Refer to Figure 2 and use the following procedure to check the oil level in the gear case. The oil level is correct when it is just below the centre line of the sight-glass (11).

- 1. Refer to Figure 2. Look at the oil level in the sight-glass (11) on the gear cover (1):
  - If the oil level is not visible in the sight-glass, or is too far below the centre line of the sight-glass, continue at Step 2 to add more oil.
  - If the oil level is above the centre line of the sight-glass, drain oil from the blower until the level is correct: refer to Section 5.7.
- 2. Remove the oil filler-plug (2) from the filler port on the top of the gear cover (1).
- 3. Pour new oil of the correct type (see Section 2.5) through the filler port and into the end cover until the oil-level is just below the centre line of the sight-glass. If the oil level goes above the centre line of the sight-glass, drain oil from the blower until the level is correct: refer to Section 5.7.
- 4. Refit the oil filler-plug (2) to the filler port on the top of the gear cover (1).

## 5.5 Inspect the system installation

Note: Where possible, we recommend that you investigate the cause of any damage or corrosion, and implement corrective measures to prevent any future damage of components.

Use the following procedure to inspect the system connections:

- I. Inspect all of the system pipelines and connections and check that they are not damaged or corroded and that they are sufficiently leak-tight. Repair or replace any damaged or corroded component and seal any leak found.
- 2. Inspect the drive/transmission system and adjust, repair or replace as necessary: refer to the manufacturer's instructions supplied with your drive/transmission system.

## 5.6 Relubricate the bearings

#### **CAUTION**

Ensure that you use the correct type of grease to relubricate the bearings (see Section 2.5) as described below. If you do not, the blower may be damaged during operation, or its performance may be affected.

Refer to Figure 2. There are two greasing points (5) on the bearing cover (7), one for each rotor bearing. Use the following procedure to relubricate the bearings:

- 1. Use a suitable tool (such as a grease gun or syringe) to force new grease through one of the the greasing points and into the bearing, until used grease is ejected through the vent (a cast slot in the cap next to the greasing point).
- 2. Use the method in Step 1 to force new grease into the other greasing point.
- 3. Use a suitable lint-free cloth or rag to wipe the used grease (ejected from the vents) off of the blower. Dispose of the cloth/rag and used grease: refer to Section 6.2.

#### 5.7 Change the oil

#### **CAUTION**

Ensure that you use the correct grade of oil and that the oil level is correct. If you do not, the blower may be damaged during operation, or its performance may be affected.

- 1. Refer to Figure 2. Remove the oil filler-plug (2) from the filler port on the gear cover (1).
- 2. Place a suitable container under the drain plug (10). The container must have a maximum capacity as specified in Tables 15 and 16.
- 3. Remove the oil drain plug (11), and allow the oil to drain from the blower into the container.
- 4. Refit the oil drain plug (11).
- 5. Dispose of the oil: refer to Section 6.2.
- 6. Fill the gear cover with new oil of the correct type and grade: refer to Section 3.6.

## 5.8 Clean/replace the gear cover vent/ filter (when necessary)

Refer to Figure 2. The gear cover vent port (13) may be fitted with an external vent filter (12), as shown in detail A. Alternatively, the vent port (13) may be open, as shown in detail B.

If there is oil in the gas stream from the blower, the gear cover vent port or the vent filter may be blocked:

- If your blower has an external vent filter, you must replace it: contact your supplier or Ingersoll Rand.
- If the vent port has no filter: check that the port is clear and unobstructed.

#### 5.9 Overhaul the blower

The blower must be regularly overhauled, as specified in Table 22. As part of the overhaul, the bearings in the blower must be replaced.

We recommend that you contact your supplier or Ingersoll Rand to arrange for an overhaul of the blower.

## 5.10 Fault finding

A guide to fault conditions and their possible causes is provided in Table 23 to assist you in basic fault finding.

If you are unable to rectify a fault when you use this guide, call your supplier or your nearest Ingersoll Rand Service Centre for advice.

Note: If you have been approved to carry out strip-down, repair and reassembly of your blower, refer to the Service Manual supplied separately for detailed procedures.

Symptom	Check	Action
The blower will not start, or seizes during operation.	Are the rotors touching ?	Check the rotor clearances and adjust as necessary.
	Has the blower been overloaded ?	Check the required operating conditions and specified performance of the blower (see Section 2).
	Has debris or foreign material entered the blower ?	Strip down, clean and repair the blower as necessary.
	Is the drive/transmission system faulty ?	Check that your drive and transmission system is operating correctly, and that it is correctly fitted to the blower: refer to Section 3.7 and to the manufacturer's instructions.
The blower is noisy during operation.	Are the rotors touching ?	Check the rotor clearances and adjust as necessary.
	Are the gear and/or bearing clearances incorrect?	Check the clearances and adjust as necessary.
	Are the rotors unbalanced ?	Clean the rotors and rotor housing, then check the rotor clearances and adjust as necessary.
The blower overheats.	Is the inlet filter blocked ?	Clean or replace the filter.
	Is the oil level too high, or has the incorrect grade of oil been used?	Check the oil level (refer to Section 5.4) or drain the blower and fill with the correct grade of oil (refer to Section 5.7).
	Has the incorrect type of grease been used ?	Relubricate the bearings with the correct type of grease (refer to Section 5.6).
	Are the rotor or rotor/casing clearances incorrect?	Contact your supplier or Ingersoll Rand for advice.
	Is there inadequate clearance around the blower ?	Ensure that there is sufficient clearance around the blower to provide for free circulation of ambient cooling air.
	Does your enclosure provide inadequate cooling?	If you have fitted an acoustic enclosure around the blower:
		Ensure that the enclosure cooling vents/louvres are unobstructed.
		Ensure that the enclosure cooling/extraction fan is operating correctly.
		Ensure that there is sufficient clearance for cooling-air flow around the blower: refer to Section 3.2.

Table 23 – Fault finding

Symptom	Check	Action
There is oil in the gas stream from the blower.	Is the oil level too high?	Check the oil level and if necessary drain oil from the blower: refer to Section 5.4.
	Have the sealing rings failed ?	Contact your supplier or Ingersoll Rand for advice.
	Is the gear cover vent/filter blocked?	Clean or replace the vent/filter as necessary: refer to Section 5.8.
Oil leaks from the drive shaft.	Have the lip seals failed ?	Inspect the lip seals and replace if necessary.
There is a low volume flow	Is the inlet filter blocked ?	Clean or replace the filter.
through the blower.	Is the blower worn or damaged ?	Contact your supplier or Ingersoll Rand for advice.
	Is the blower unsuitable for your application ?	If necessary, redesign your system to comply with the capabilities of the blower, or fit a different blower which provides the necessary performance.
Absorbed power is too high.	Is the blower unsuitable for your application ?	If necessary, redesign your system to comply with the capabilities of the blower, or fit a different blower which provides the necessary performance.
	Is the inlet filter blocked ?	Clean or replace the filter.
The blower rotates in reverse direction when you stop it.	Is the non-return valve defective ?	If you have fitted a non-return valve in your outlet pipeline, check that the non-return valve operates correctly. Repair or replace as necessary.
-	-	If you have made the checks/actions as described above and you still cannot identify the cause of a fault, or if you cannot rectify a fault, contact your supplier or Ingersoll Rand for advice.

Table 23 – Fault finding (Continued)

PAGE

## Series 2000 and S2H22-53 Blowers

## 6 STORAGE AND DISPOSAL

#### 6. I Storage

#### 6.1.1 Preparation

- I. Shut down the blower as described in Section 4.3.
- 2. If necessary, disconnect the drive and transmission system from the blower drive shaft: refer to the manufacturer's instructions supplied with your transmission system.
- 3. If necessary, purge your system and the blower with dry air, and disconnect the blower from your system pipelines.
- 4. If you will store the blower for longer than six weeks, refer to the additional requirements in Section 6.1.2.
- 5. Place and secure protective covers over the blower inlet and outlet connections.
- 6. Use suitable lifting equipment to move the blower to its storage area: refer to Section 3.4.
- 7. Store the blower in clean, dry conditions in a well-ventilated place that is free from vibration or shocks

## 6.1.2 Preparation for long-term storage

If the blower is to be stored for longer than six weeks:

- I. Drain the oil from the blower: refer to Section 5.7.
- 2. Fill the gear cover with a suitable protective oil (see Table 24): use the method in Section 5.4.
- 3. Relubricate the bearings: refer to Section 5.6.
- 4. Turn the blower drive shaft by hand through three or four revolutions, to turn the blower and prevent seizure.
- 5. Spray a suitable protective oil (see Table 24) through the inlet/outlet and into the blower.
- 6. If required, spray a suitable protective oil (see Table 24) on the bare metal surfaces of the blower inlet and outlet flanges, to inhibit corrosion.

During storage, every 14 days or less, turn the blower drive shaft by hand through at least one quarter of a revolution, to turn the rotors and prevent seizure or degradation of the bearings.

External components	Internal components
Rust Ban 324 (Esso)	Mobilarma 523/524 (Mobil)
V Product 9703 (Shell)	Esso Lub MZ 20E/20 (Esso)
Mobilarma 778 (Mobil)	Ensis Motor Oil 20 (Shell)

Table 24 – Suitable protective oils

## 6.1.3 Preparation for use after long-term storage

When the blower is required for use after storage:

- I. Drain the protective oil from the gear cover, then fill the gear cover with new oil: refer to Section 5.7.
- 2. Relubricate the bearings: refer to Section 5.6.
- 3. Where possible (see Note below), use a suitable cleaning solution (such as alcohol or white spirit) to clean the rotors:
  - Moisten a suitable clean, lint-free cloth with the cleaning solution, and clean the parts of the rotors which are visible through the inlet port.
  - Turn the blower drive shaft as necessary to access the other rotors.
- 4. Prepare and install the blower as described in Section 3.

Note: The small size of the inlet/outlet ports on some of the blowers means that you may not be able to clean the rotors of these blowers as described above.

#### 6.2 Disposal

Ensure that you wear the appropriate Personal Protective Equipment (PPE) when you handle contaminated oil or grease, or contaminated components.

Safely dispose of the blower, used oil, used grease, cleaning materials, and any components in accordance with all local and national safety and environmental requirements.

Take particular care with the following:

- Used oil or grease that has been contaminated with dangerous substances.
- Cleaning materials that have been contaminated with dangerous substances.
- Components that have been contaminated with dangerous substances.

## 7 SERVICE AND SPARES

#### 7.1 Introduction

Ingersoll Rand products, spares and accessories are available from Ingersoll Rand companies in Belgium, Brazil, China, France, Germany, Israel, Italy, Japan, Korea, Singapore, United Kingdom, U.S.A and a world-wide network of distributors. The majority of these centres employ Service Engineers who have undergone comprehensive Ingersoll Rand training courses.

Order spare parts and accessories from your nearest Ingersoll Rand company or distributor. When you order, state for each part required:

- Model and Item Number of your equipment
- Serial number
- Item Number and description of part.

#### 7.2 Service

Ingersoll Rand products are supported by a world-wide network of Ingersoll Rand Service Centres. Each Service Centre offers a wide range of options including: equipment decontamination; service exchange; repair; rebuild and testing to factory specifications. Equipment which has been serviced, repaired or rebuilt is returned with a full warranty.

Your local Service Centre can also provide Ingersoll Rand engineers to support on-site maintenance, service or repair of your equipment.

For more information about service options, contact your nearest Service Centre or other Ingersoll Rand company.

#### 7.3 Spares

The spares available for the blowers are shown in Table 25 (page 41).

## Note that:

- The minor repair kits contain seals and associated gaskets.
- The major repair kits contain bearings, seals and associated gaskets

Spare	Item Number
Winter/Summer Mobil SHC 630 oil: 2 litres (0.53 US gal)	LUB1000002
Winter/Summer Mobil SHC 630 oil: 5 litres (1.32 US gal)	LUB1000005
Minor repair kits	
S2H22, S2H23, 2022, 2023	H2020MISK
